

Task 4.4 – Social Engineering

(Simulation Only)

Objective:

Create a phishing awareness simulation page and demonstrate phishing detection techniques. The webpage is for educational purposes only and does not collect, store, or transmit user credentials.

Tools Used:

- HTML5
- CSS3
- JavaScript
- Visual Studio Code
- Google Chrome

Project Overview:

A secure employee login portal was created to simulate a phishing webpage. Users can enter sample credentials and click the Sign In button. Instead of authenticating the user, the application displays a phishing awareness message with security recommendations.

Features:

- Responsive login interface
- Professional dark theme
- Email and password fields
- Phishing awareness tips panel
- Educational warning after login attempt
- No credentials stored or transmitted
- Awareness disclaimer

Procedure:

1. Developed the HTML login page.
2. Styled the interface using CSS.
3. Added JavaScript to display the awareness message.
4. Tested the webpage in a browser.
5. Verified that submitted credentials are discarded and only awareness information is displayed.

Figure 2: Sample credentials entered into the simulation

Figure 3: Awareness message displayed after form submission

Result:

The phishing simulation page successfully demonstrated how phishing websites imitate legitimate login portals while educating users about recognizing phishing attempts.

Conclusion:

The project achieved its objective of improving phishing awareness through a safe simulation environment. Screenshot
